                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              expression system encoding a chimeric CD4 protein. The ER-localised chimeric CD4 molecule binds to the HIV-1 envelope protein gp160, resulting in HIV-1 retention in the ER and thereby preventing viral replication. In a specific embodiment, the chimeric CD4 molecule comprises CD4 fused to 15 amino acids of the C-terminal domain of the T cell receptor CD3epsilon chain; this chimeric CD4 molecule is designated CD4epsilon15 (ADA44807). A known chimeric CD4 of similar structure but containing only 10 amino acids from CD3epsilon can also be used. CCmpositions of the invention have an in trans effect on the replication of HIV-1, and may be used to treat and prevent HIV-1 infection. The present sequence represents the chimeric CD4 molecule CD4epsilon15, which is specifically claimed for use in compositions of the invention.

The invention provides a fusion gene encoding

D)

fusion protein that

fusion gene encoding immunoglobulin-CD4 fusion proteins, useful in treatment of HIV or simian immunodeficiency virus infections.

The fusion protein is capable of being secreted. The fusion proteins are useful for treating HIV or SIV infections in animals, preferably humans. They are also useful for producing medicaments which can be used for treating HIV or SIV infections in humans. The present sequence represents the fusion protein CD4Mmu where the CD4 is linked to human IgG1 at the Mst2 site upstream of the CH1 region

The present sequence is that of fusion protein CD4Pmu comprising the extracellular portion of CD4, which binds to HIV gp120, linked at its C-terminus to the human IgM heavy chain. To obtain the fusion protein, DNA encoding CD4 was linked to IgM DNA at the Pst site upstream of the CH2 region (see AAA$0663). Fusion protein CD4Pmu and a nucleic acid encoding it are claimed. Also claimed are a vector comprising the nucleic acid, and a method of producing the fusion protein in secreted form using a transformed host cell. The fusion protein may further comprise a transformed host cell. The fusion protein may further comprise a therapeutic agent, radiolabel or NMR imaging agent. The fusion protein can be administered to an animal (including humans) for treatment of HIV or SIV infection, and can also be used in assays for HIV or SIV, imaging and tissue stains. IgM fusion proteins such as CD4Pmu provide complement—
                                                                                                                                                                                                                                                                                                                                                                                                                                                            \mathtt{CD4-immunoglobulin} fusion proteins, useful \mathtt{SIV}.

The products pf the invention have anti-human immunodeficiency virus (HIV) activity and are capable of binding to gp120. The fusion protein is useful for treating human immunodeficiency virus (HIV) or similar immunodeficiency virus (SIV). This sequence represents the fusion protein CD4Pmu which is constructed from CD4 linke to human IgM upstream of the CH2 region

                                                                                                                   54-60; 89pp; English
                                                                                                                                            ij
```

The invention provides a fusion gene encoding a fusion protein that comprises an extracellular CD4 DNA sequence or its fragment which binds to HIV gp120 when fused to an immunoglobulin (1g) chain and the DNA sequence of an Ig heavy or light chain, where the DNA sequence encoding the variable region has been replaced with the DNA sequence which encodes extracellular CD4 or its gp120 binding fragment. The fusion protein is capable of being secreted. The fusion proteins are useful for treating HIV or SIV infections in animals, preferably humans. They are also useful for producing medicaments which can be sed for treating HIV or SIV infections. The present sequence represents the fusion protein in the fusion protein in animals. The present sequence represents the fusion protein could be seen to the fusion protein in the fusion p Sequence 481 CH2 region A A

sCD4-SCFv(17b) HIV single chain antibody fusion protein. 08-FEB-2001 (first entry)

Fusion protein; HIV; human immunodeficiency virus; antibody; Fv, acquired immune deficiency syndrome; neutralisation; infection; gene therapy; CD4; gpl20; glycoprotein; resistance; vaccination; binding domain; single chain antibody; chimera; chimeric proteir

Human immunodeficiency virus

Synthetic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 유
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC (containing domains D1 and D2) fused to a single chain FV portion of CC antibody 17b via a linker. sCD4-SCFV(17b), its variant, analogue or mimetic is used for inactivating gp120 protein of HIV, and for centralising HIV. It is also used for blocking and preventing the binding CC of the viral or recombinant gp120 protein to soluble CD4 or lymphocyte CC therefore useful for treating HIV infection and also AIDS. It is are particularly useful in the prevention of infection during or immediately after HIV exposure (e.g., mother/infant transmission, post-exposure CC prophylaxis, and as a topical inhibitor) and for providing long term cresistance to HIV infections and AIDS. Gene therapy is used to secrete the bispecific protein at mucosal surfaces, such as the vaginal, rectal creative with neutralising antibody with high in vivo activity and no Fc mediated undesirable targetting properties. When the fusion protein is substantially derived from human proteins, it has minimal immunogenicity and toxicity in humans which is of great value in prevention of infection of during or immediately after HIV exposure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

The protein comprises a fibinding domain capable of binding to an inducing site on the target protein, a second binding domain capable of forming neutralising compwith an induced epitope of the target protein and a linker connecting binding domains. SCD4-SCFV(17b) comprises a soluble CD4 fragment

                                                                                                                                                                                                                                                                                                             The sequence was deduced from the DNA sequence of subclone PATY.6, conty DNA coding for the full-length human CD4. The clone was constructed from plasmids pBG178A and pBG378 (both in USB02940). The DNA can be used to express recombinant CD4 and analogues for use in diagnosis and treatment of diseases caused by infective agents whose primary targets are T4+ lymphocytes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel nucleic acid (I) encoding a fusion protein comprising a DNA sequence encoding amino acids 1-173 of CD4 (II) and a DNA sequence encoding a minon acids 1-18 of chain (III). The products pf the invention have anti-human immunodeficiency virus (HIV) activity and are capable of binding to gp120. The fusion protein is useful for treating human immunodeficiency virus (HIV) or similan immunodeficiency virus (SIV). This sequence represents the fusion protein CD4Egammal which is constructed from CD4 linked to human IgG1 upstream of the hinge region

The fusion protein is capable of being secreted. The fusion proteins are useful for treating HIV or SIV infections in animals, preferably humans. They are also useful for producing medicaments which can be used for treating HIV or SIV infections. The present sequence represents the fusion protein CD4Bgammal where the CD4 is linked to human IgG1 at the Banl site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Seed

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The fusion protein genes of the invention pref. comprise cDNA sequences which encode CD4 or a fragment which binds gpl20 ligated to an expression plasmid which encodes an antibody in which the variable region of the gene has been deleted (see W087-02671). The CD4 portion of the fusion protein may comprise the complete CD4 sequence, the 370 AA extracellular region and the membrane spanning domain, or the extracellular region. The IJ heavy chain is pref. from IJM, IJG11 or IJG3. The following are specifically claimed: fusion proteins CD4H-gamma-1, CD4Hmu, CD4E-gamma1, and CD4Hmu (NO.6760B), pCD4P-gamma (NO.6760B) and pCD4E-gamma-1 (NO.6760B). The plasmid containing (pCD4E-gamma-1) has been deposited in E. coli (MC1061/PJ) at the ATCC under accession number 67610. (Updated on 25-MAR-2003 to correct PA field.)

                                                                                                                                                                                                                                                                                                                                      The present sequence is that of fusion protein CD4Bgammal comprising the extracellular portion of CD4, which binds to HIV gp120, linked at its C-terminus to the human IgG1 heavy chain. To obtain the fusion protein, DNA encoding CD4 was linked to IgG1 DNA at the Esp site upstream of the hinge region (see AAA50661). Fusion protein CD4Bgammal and a nucleic acid encoding it are claimed. Also claimed are a vector comprising the nucleic acid, and a method of producing the fusion protein in secreted form using a transformed host cell. The fusion protein may further comprise a therapeutic agent, radiolabel or NMR imaging agent. The fusion protein can be administered to an animal (including humans) for treatment of HIV or SIV infection, and can also be used in assays for HIV or SIV, imaging and tissue stains. IgG1 fusion proteins such as CD4Bgammal provide both complement-mediated and cell-mediated immunity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI; 2000-586558/55

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel nucleic acid (I) encoding a fusion protein comprising a DNA sequence encoding amino acids 1-173 of CD4 (II) and a DNA sequence encoding amino acids 1-18 heavy or light chain (III). The products pf the invention have anti-human immunodeficiency virus (HIV) activity and are capable of binding to gp120. The fusion protein is useful for treating human immunodeficiency virus (HIV) or simian immunodeficiency virus (SIV). This sequence represents the fusion protein CD4Egammal which is constructed from CD4 linked to human IgG1 upstream of the hinge region

The fusion protein is capable of being secreted. The fusion proteins are useful for treating HIV or SIV infections in animals, preferably humans. They are also useful infections in humans. The presents the cuse of treating HIV or SIV infections in humans. The presents the fusion protein CD4Bgammal where the CD4 is linked to human IgG1 at the Bsp site upstream of the hinge region

The CD4 portion of the fusion protein may comprise the complete CD4 sequence, the 370 AA extracellular region and the membrane spanning domain, or the extracellular region. The Ig heavy chain is pref. from IgM, IgG1 or IgG3. The following are specifically claimed: fusion proteins CD4H-gamma-1, CD4Mmu,CD4Pmu,CD4E-gamma1, and CD4Mmu (No.67608), pCD4P-gamma (No.67609) and pCD4E-gamma-1 (No.67609). The plasmid concaining (pCD4H-gamma-1) has become deposited in E. coli (MC1061/P3) at the ATCC under accession number 67611. (Updated on 25-MAR-2003 to correct PA field.)

                                                                                                                                                                                                                                                                          The present sequence is that of fusion protein CD4Hgammal comprising the extracellular portion of CD4, which binds to HIV gpl20, linked at its C-terminus to the human IgG1 heavy chain. To obtain the fusion protein, DNA encoding CD4 was linked to IgG1 DNA at the Hind3 site upstream of the CH1 region (see AAA50660). Fusion protein CD4Hgammal and a nucleic acid encoding it are claimed. Also claimed are a vector comprising the nucleic acid, and a method of producing the fusion protein in secreted form using a transformed host cell. The fusion protein may further comprise a therapeutic agent, radiolabel or NMR imaging agent. The fusion protein can be administered to an animal (including humans) for treatment of HIV or SIV infection, and can also be used in assays for HIV or SIV, imaging and tissue stains. IgG1 fusion proteins such as CD4Hgammal provide both complement-mediated and cell-mediated immunity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI;

                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel nucleic acid (I) encoding a fusion protein comprising a DNA sequence encoding amino acids 1-173 of CD4 (II) and a DNA sequence encoding a human immunoglobulin (Ig) heavy or light chain (III). The products pf the invention have anti-human immunodeficiency virus (HIV) activity and are capable of binding to gp120. The fusion protein is useful for treating human immunodeficiency virus (HIV) or simian immunodeficiency virus (SIV). This sequence represents the fusion protein CD4H-1 which is constructed from CD4 linked to human IgG1 upstream of the CH1 region

                                                                                                                                                                                                                                                                                                                                               The invention provides a fusion gene encoding a fusion protein that comprises an extracellular CD4 DNA sequence or its fragment which binds to HIV gp120 when fused to an immunoglobulin (1g) chain and the DNA sequence of an Ig heavy or light chain, where the DNA sequence encoding the variable region has been replaced with the DNA sequence which encodes extracellular CD4 or its gp120 binding fragment. The fusion protein is capable of being secreted. The fusion proteins are useful for treating HIV or SIV infections in animals, preferably humans. They are also useful for producing medicaments which can be add for treating HIV or SIV infections in humans. The present sequence represents the fusion protein CD4Hgammal where the CD4 is linked to human IgG1 at the Hind3 site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 2000-063015/06.

                                                                                                                                                                                                                                                                      Human CD4 cDNA was excised from pSP6T4 and cloned into M13mp18. The 2 kb PstI/PstI fragment from pBR lambda 1 contg. the human lambda 1 heavy chain gene (contg. the hinge, CD4 and CH3 exons) was isolated and cloned into the BAP-treated M13mp18/CD4 vector. To obtain a CD4-lambda 1 chimeric heavy chain gene, oligonucleotide-mediated site-directed mutagenesis was performed to juxtapose the CD4 and lambda 1 heavy chain DNA sequences, ligating the CD4 sequence in frame to the hinge exon. The DNA was then cloned into pcDNA-1 to produce CD4-IgG1-pcDNA1 (ATCC 40951). (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                               Example; Fig 3; 88pp; English.

The method is useful for preparing protein arrays based on biochemical protein-protein interactions. Arrays produced by this method are useful for screening drug targets. This sequence represents the human CD4 receptor, used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 458
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    preparing a protein array useful for screening drug targets comprises depositing an array of a first protein on substrate, and applying a second protein comprising an amino acid sequence that binds to a doma: of the first protein.

The CD4 portion of the fusion protein may comprise the complete CD4 sequence, the 370 AA extracellular region and the membrane spanning domain, or the extracellular region. The Ig heavy chain is pref. from IgM, IgG1 or IgG3. The following are specifically claimed: fusion proteins CD41mabda1, CD49mu, CD49mu, CD49mu, CD49mu (No. 67609) and CD49mu (No. 67610).

                                                                                                                                                                                                                                                                                                                                                                                                                                                           The fusion protein genes of the invention pref. comprises cDNA sequences which encode CD4 or a fragment which binds gp120 ligated to an expression plasmid which encodes an antibody in which the variable region of the gene has been deleted (see Wo87-02671). The CD4 portion of the fusion protein may comprise the complete CD4 sequence, the 370 AA extracellular region and the membrane spanning domain, or the extracellular region. The graph contain is pref. from IgM, IgG1 or IgG3. The following are specifically claimed: fusion proteins CD4Flambda1, TD4Fmu, CD4Fmu, CD4Elambda1, and CD4Mmu (No. 67608), pCD4Flambda (No. 67609) and pCD4Elambda1 (No. 67610). (Updated on 25-MAR-2003 to correct PA field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents an aqueous-soluble polypeptide comprising a portion of a human T4 glycoprotein. The portion specifically forms a complex with a human immunodeficiency virus (HIV) envelope glycoprotein. The DNA is useful for producing the soluble surface T4 glycoprotein. The soluble surface T4 glycoprotein is useful as a therapeutic agent, i.e. as prophylaxis for treating a subject infected with an HIV virus. Thus, the soluble T4 glycoprotein is useful for treating human AIDS. The soluble T4 glycoprotein is useful for treating human AIDS. The soluble T4 glycoprotein is also useful in diagnostic or screening assays, e.g. for screening inhibitors of virus binding, or for detecting and quantitating T4, T4+ cells and antibodies to T4, which are of diagnostic value for

                                                                                                                                                                                                                                      Soluble T4 can be produced by truncating the CDS to remove the transmembrane and cytoplasmic domains. The soluble forms may be modified to increase their immunogenicity by addition of an adjuvant such as incomplete Freund's adjuvant. The T4 interferes with HIV/T4 interaction and elicite anti-soluble T4 antibody production. Soluble T4 proteins include the following polypeptide fragments: amino acids 1-385, 24-385, Met-24-385, 24-397, 1-400 and Met-24-400. See also AAQOS608. They can be used to purify HIV from a sample. The soluble T4 protein-based compans. are useful in treating immunodeficient patients suffering from diseases caused by agents whose primary targets are T4+ lymphocytes. They can be used for preventing, treating or detecting AIDS, ARC and HIV infection. (Updated on 25-MAR-2003 to correct

                                                                                                                                                                  Entire sequence from T4-encoding plasmid p170-2. It is almost identical to the sequence published by Maddon et al. (1985) with the exception of three codon changes. At T4 amino acid residue 3, (posn. 403 of entire sequence) Lys is encoded in stead of Asn. At posn. 64, (posn. 464) Arg replaces Txp and at posn. 23, (posn. 631) Ser replaces Phe. Soluble T4 can be produced by truncating the CDS to remove the transmembrane and cytoplasmic domains. The soluble forms may be modified to increase their immunogenicity by addition of an adjuvant such as incomplete Freund's adjuvant. The T4 interferes with HIV/T4 interaction and elicits antisoluble T4 antibody production. See also AAQ05608. (Updated on 31-OCT-2002 to add missing OS field.)
                                                                                                                                                                                                                                                                                                                                                            Treating or preventing AIDS, ARC or HIV infection - by administering an immunologically effective amt. of soluble T4 protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  25-MAR-2003
31-OCT-2002
29-MAY-1990
                  The sequence differs from that determined by PJ Madden et al., [Cell, 42 pp. 93-104 (1985)] in three places due to three nucleotide substitutions. The Asp reported at position 3 by Madden et al. was the result of a sequencing error [DR Littman et al. Cell, 55, p.541 (1988)]. X = stop codon. The sequence was deduced from the cDNA insert of p170-2. Soluble T4 constructs may be produced by truncating this sequence to give fragments from position 400 to 799, removing the transmembrane and intracytoplasmic domains whilst retaining the extracellular region responsible for HIV binding. The sol. T4 is combined with an anti-viral agent such as AZT. See also AAQ03006. (Updated on 31-OCT-2002 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA field.)

The T4 protein encoded by p170.2 is almost identical to that reported by P.J. Maddon et al [Cell, 42, pp 93-104 (1985)]. The Maddon sequence was revised in 1988 to correct a DNA sequencing error at AA 3 (corrected from Asp to Lye; see M12807 in GenBank). The DNA may be truncated (to remove transmembrane and intracellular regions) and/or modified by SDM, pref. so the prod. extends from AAs 3-183 of the mature protein. This DNA can then

```

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               be ligated to a toxin DNA esp. angiogenin, or a fragment of Pseudomonas exotoxin A contg. the translocation and ADP-ribosylation domains. The hybrid DNA can then be inserted into an expression vector and used to produce recombinant fusion protein which is useful for preventing or treating AIDS, ARC, and HIV infections. The 14 protein is an HIV receptor which binds to virus or to infected cells carrying the gpl20/160 marker antigen, so provides v. specific targetting with minimal damage to non-target cells. (Updated on 31-OCT-2002 to add missing OS field.)
                          New non-human primate and human CD4 or gp120 molecules - used to treat HIV or SIV and immunoglobulin and gp120 binding molecules from new fus proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Misc-difference
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   gp120 binding protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAR11285 standard; protein; 458
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 458 AA;

The PCR fragments were ligated into sequencing plasmid phy808 (see AAQ20326) The DNA sequence can be used to express recombinant soluble CI and analogues for use in diagnosis and treatment of diseases caused by infective agents whose primary targets are T4+ lymphocytes. Animals which can be treated include humans, baboons, orang-utans, chimpanzees, gorillas and thesus monkeys. The chimpanzee CD4 is 99 per cent homologous to its human counterpart, possessing 5 amino acid substitutions in the 433 residue predicted mature polypeptide. See also AAQ10885, AAQ10887-8. The DNA sequence can be used to express recombinant soluble procedure. The DNA sequence can be used to express recombinant soluble CD4 and analogues for use in diagnosis and treatment of diseases caused by infective agents whose primary targets are T4+ lymphocytes. The fusion protein genes of the invention pref. comprises cDNA sequences which encode CD4 or a fragment which binds gp120 ligated to an expression plasmid which encodes an antibody in which the variable region of the gene gene has been deleted (see Wo87-02671). The CD4 portion of the fusion protein may comprise the complete CD4 sequence, the 370 AA extracellular region and the membrane spanning domain, or the extracellular region. The

T helper
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 extracellular portion of CD4, which binds to HIV gp120, linked at its C-terminus to the human IgG1 heavy chain. To obtain the fusion protein, DNA encoding CD4 was linked to IgG1 DNA at the Ban1 site downstream of the hinge region (see AAA50664). Fusion protein CD4Bgammal and a nucleic acid encoding it are claimed. Also claimed are a vector comprising the nucleic acid, and a method of producing the fusion protein in secreted form using a transformed host cell. The fusion protein may further comprise a therapeutic agent, radiolabel or NMR imaging agent. The fusion protein can be administered to an animal (including humans) for treatment of HIV or SIV infection, and can also be used in assays for HIV or SIV, imaging and tissue stains. IgG1 fusion proteins such as CD4Bgammal provide both complement-mediated and cell-mediated immunity
                                                                                                                                                                                                                                                                                                                                                                Human immunodeficiency virus; HIV; gp 120; AIDS; ARC; glycoprotein; acquired immune deficiency syndrome; AIDS related complex; monkey;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          It is the protein sequence encoded by the rsT4 sequence. It is claimed the patent. It is useful in immunotherapeutic, prophylactic and diagnostic compans. It can be used to purify HIV from a sample. (Update on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DNA sequences coding for soluble T4-like immuno:therapeutic and immunosuppressive treating or detecting AIDS.

No. 18 the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
